

ASTROHACK 2026 · PROJECT SUBMISSION

AstroLive

A working web app to talk to an astrologer, save what they said with a date, and later mark whether it came true.

What this product is

AstroLive is an astrology consultation app, like AstroTalk or the existing astrolive.app: you pick a live expert and talk by chat, phone, or video, paying from a wallet by the minute.

After the call, this app does one extra thing those products do not. You save one sentence the astrologer said, and you pick a date by which it should happen — for example, “a job offer will come by 14 August.” When that date arrives, Home asks you: did it happen? You mark Yes, Partly, or No.

That answer becomes a public page. Anyone can open it without logging in. If a friend signs up from the invite on that page, both of you get Rs 50 of talk time. Experts on the public board are ranked by these dated results, including the ones that missed, not only by star ratings.

Around that, the app also has kundli, panchang, kundli matching, daily horoscope, short reels, online puja as its own session, an Ask AI chat on your birth chart, English and Hindi, and UPI wallet top-up. Those tools support the consultation. The thing this product adds is the dated line, the later mark, and the public page.

What a user actually does (example)

Arjun logs in, opens Talk now, and starts a video session with Acharya Indu Prakash. The first three minutes are free; after that the wallet is charged per minute. He saves the line “a job offer will land in tech” with the date 14 August. On 14 August, Home shows that line and asks if it happened. He marks Yes. A public card is created. He sends the link to his sister. She opens it with no account. If she signs up with his code ARJUN, both wallets receive Rs 50, and she can talk to an expert herself.

Field	Value
What to open	http://127.0.0.1:5174 (API on port 8787)
Demo login	arjun.sharma@example.com / cosmic2026
Invite code	ARJUN (both people get Rs 50 talk credit)
See a finished card (no login)	/p/proof-dp2?from=ARJUN
See experts ranked by results (no login)	/board
See yeses and misses (no login)	/tape
This file	Written record of the working prototype. The live app is the product.

Contents

1. Problem statement — why the current apps stop too early

2. Analysis of AstroLive.app — what exists today, what is missing
3. Our solution — what we built and how a user uses it
4. Everything in the prototype — screens, wallet, plans, tools
5. How it is built — server, wallet, payments, live call
6. Expected impact — what changes if people use the dated line
7. Success metrics — how we will know it is working
8. How to try it — step-by-step for judges
9. Appendix — full list of pages, APIs, and limits

1. Problem statement

What people hire astrology for

A user opens an astrology app because a decision has a date: a job, a marriage window, money, a visa, health. They want a person to look at a chart and say something specific. Later they want to know whether that something happened. Therapy is still hard to ask for in much of this audience. A consultation with an astrologer is not. That is the job.

What the category actually sells

The live-astrology category in India is a pay-per-minute marketplace. AstroTalk, the category leader, reported about Rs 1,176 crore operating revenue in FY25, with consultations still roughly 80–90% of mix and about 1.5 million transacting users. Repeat is reported around 25–30%. Chat, call, and video are billed by the minute. Trust is shown as stars and years of experience. After the call, the product offers a daily horoscope tile, a kundli tool, and increasingly a remedies shop.

Demand is not the problem. The product after hang-up is the problem.

Three failures this submission treats as the brief

Acquisition is paid

A session produces nothing a user would send except a screenshot of a chat. There is no page with a link. Growth is ads, coupons, and first-free minutes. When the coupon ends, the user has nothing to show a sister, and no reason for her to open the same app.

Retention is a tile

Daily horoscope is a commodity paragraph. After the call, advice sits in a transcript the user does not reopen. There is no unfinished personal job that is due on a specific morning. Push notifications repeat the same sky sentence for millions of people.

Trust is a star

A 4.9 rating does not say whether the last ten dated claims came true. High-intent users (career, money, marriage) cannot tell who is specific and who is vague. The product never required a date and never required an ending, so ranking cannot be honest.

What the hackathon brief asked for

The brief asks us to add at least one of: a way the product spreads by itself, a reason to come back every day, a new way to earn money, or a unique selling point — without copying AstroTalk's shop. This prototype uses one thing for all four: a prediction with a date and a later Yes/No. Spreading happens when someone sends the public page. Coming back happens when the date arrives. New money sits on that record (Plus keeps the full list; a PDF and a second opinion cost extra). The unique point is ranking astrologers by those dated results. Everything else in the app supports that.

2. Analysis and teardown of AstroLive

AstroLive (astrolive.app; App Store and Play Store as “AstroLive – Talk to Astrologer”) is a live-consultation marketplace in the same job as AstroTalk. It is the product being analysed here, and the product a naive rebuild would copy.

What AstroLive.app is today

- Live audio or video with astrologers. Store listings still say a nominal Rs 10 per call; the website sells chat at Rs 10/min and talk at Rs 15/min.
- A free trial for new users (three free calls in store copy; first consultation free on the marketing site).
- Chat as a second mode. No booking slot required if someone is online.
- Wallet.
- Utility row: daily horoscope, today’s panchang, kundli match, free kundli, love calculator.
- A grid of astrologers and live sessions, then an app-download CTA.

This is the AstroTalk home screen with a smaller catalogue: faces, a rate, a wallet, and free tools that give a non-paying user something to tap. It is not a distinct product. It is the same job with less inventory.

The user journey and what the product keeps

Step	User action	What remains after
Land	Sees faces, rates, online dots	A browse session. No artifact.
Tap a tool	Kundli, horoscope, love calculator	A generated page. Commodity.
Pick a face	Skill, language, price	A star and a rate.
Pay or trial	Wallet or first-free minutes	A balance. Table stakes.
Talk	Chat, call, or video. Clock runs.	A transcript, if anything.
Hang up	Advice is in the user’s head	Nothing dated. Nothing public.
Next day	Horoscope tile or a push	The same paragraph as everyone.
Share	Screenshot of a chat bubble	No new user. No proof.

The hole is after hang-up. Everything above hang-up is a commodity. Everything below it is missing. That hole is what this prototype fills.

Feature versus job

Surface on AstroLive.app	Job it claims	What this prototype does with it
Talk / chat / video	Get advice now	Kept. This is the engine.
Wallet	Pay without friction	Kept. Server ledger + UPI.
Free first minutes	Lower trial anxiety	Kept. First 3 minutes free, then ticker.
Daily horoscope	Reason to open tomorrow	Replaced as the hook by due claims. Horoscope still exists as a computed public page.
Free kundli	Utility / SEO	Kept as a public Lahiri D1. No account.

Surface on AstroLive.app	Job it claims	What this prototype does with it
Kundli match	Marriage intent	Kept as 36-guna Ashtakoot, not a love calculator.
Panchang	Today's five limbs	Kept. Computed for place, not a copied table.
Astrologer grid	Pick a person	Kept. Rank is by dated results on /board, not stars first.
Shop / pooja mall	Second revenue	Not cloned. Puja is its own sitting, not a SKU wall.
Star ratings	Trust	Replaced as the primary rank by a public board of marked outcomes.

Where AstroLive.app is weaker than AstroTalk, and why copying either is the wrong rebuild

AstroTalk has supply (thousands of astrologers), brand ("talk now" already means them for a large Hindi-speaking audience), and a remedies store. AstroLive.app cannot win a density contest against that, and a hackathon rebuild cannot either. Copying the mall, the fire animation, the SKU grid, or a larger AI-card dashboard produces a smaller AstroTalk. It does not produce a reason to exist.

The teardown conclusion used in this build: keep the live minute. Do not make the mall the identity. Require a date on saved advice. Require a mark when the date arrives. Publish the ending, including misses. Put the invite on that public card. Rank experts on those endings.

3. Our solution — what we built and how a user uses it

In one paragraph

We built a website where you talk to a real astrologer, pay by the minute, and then keep a written, dated record of what they predicted. When the date comes, you mark whether it came true. That mark is a page you can send to anyone. That is the whole product. Kundli, horoscope, reels, puja, and Ask AI are extra tools around it.

Step by step, what the user does

1. Create an account or use the demo. New accounts receive Rs 150 in the wallet. The first three minutes of a live session are free.
2. Open Talk now. Choose an astrologer who is online. Start chat, call, or video. The clock charges the wallet after the free minutes.
3. Save one sentence they said, with a date. The app will not save the line if there is no date. “Soon” is not enough.
4. Leave. The advice is not gone. It sits in Results with that date.
5. When the date arrives, Home shows the line and asks: Did this happen? Mark Yes, Partly, or No.
6. The app publishes a public page for that result. You can send the link. The other person does not need to log in to read it.
7. If they create an account from your invite code, both of you get Rs 50 of talk time, and they can start at step 2.
8. The public board lists astrologers by how these dated marks turned out, including misses. That is how we show who is specific, instead of only showing 4.9 stars.

What must be saved for this to work

What is saved	Rule	If it is missing
The sentence	One line the astrologer actually said	The chat disappears. There is nothing to come back to.
The date	A real calendar day, not “soon”	The app cannot remind you, and cannot rank the expert.
Your mark	Yes, Partly, or No, typed by you	Nobody knows if it came true. The board is empty.
The public page	A link anyone can open, including misses	You cannot send it. Friends cannot join from it.

If there is no date, the line is not saved. If there is a date but you have not marked it yet, Home keeps asking. If you mark No, that miss still appears on the public board. We do not hide failed predictions.

How the brief maps to what was built

Brief pillar	What the product does	Where to open it
Structural virality	Public proof URL. Invite rides on the link. Both wallets move.	/p/:id?from=CODE /app/share
Habit	Due prediction on Home. Daily check-in. Seven days adds Rs 10.	/app/dashboard /app/ledger /app/today
New revenue	Minutes, invite credit, streak, Plus, Family, dated PDF, second opinion, puja sitting, UPI packs.	/app/wallet /app/subscription
USP	Experts ranked by dated, marked results — not stars.	/board Talk now sort

4. Prototype functionality — every surface that was built

This section is the inventory. If a judge asks “what did you make?”, the answer is this list, running in the browser against the API on port 8787.

4.1 Public site (no account)

Route	What it does
/	Home page. What the product is, who is online, pricing, FAQ. English/Hindi. Login on the top right.
/login /signup /forgot-password	Auth. Demo fill for Arjun. Forgot-password is honest: this demo does not send mail; it shows the sample login.
/p/:id	Public proof card. Date, result, expert, invite. Opens with no login.
/board	Experts ranked by marked dated outcomes, including misses.
/tape	Public tape of yeses and misses after life answered.
/kundli	Free North-Indian D1. Lahiri sidereal from birth time and lat/long. No account.
/panchang	Today's five limbs for a place, computed, not a copied table.
/horoscope	Daily / tomorrow / week / month from today's Moon, not a stock paragraph.
/match	Two charts, 36 gunas (Ashtakoot). Not a love calculator.
/report /terms /privacy	Public report page, terms, privacy.

4.2 Inside the app — five jobs in the nav

After login the chrome is five jobs, not a twelve-item dashboard. Desktop left rail and mobile dock: Home, Reels, Talk now, Puja, Results. Search (Ctrl/Cmd K) reaches the rest. Ask AI is on the rail as well.

Job	Route	What the user does
Home	/app/dashboard	Due prediction if a date has arrived. Otherwise today's sky, natal D1, who is on the line. First-login cashback popup (Rs 150) once.
Reels	/app/reels	Full-screen retention: quotes, facts, astrologer lines. Glyphs, not a black quote card. Not a shop.
Talk now	/app/consult	Pick an expert. Chat, call, or video. Rate per minute shown. Opens the live room.
Puja	/app/puja	Its own sitting, not a row inside Talk now. Book a rite from wallet, then /app/puja/session/:id. No fire animation.
Results	/app/ledger	Saved dated lines. Tabs. Did this happen? Close writes a public proof. Second opinion (Rs 99) when two experts spoke to the same line.

4.3 Live consultation room

Route: /app/room/:id. This is the live call screen: the astrologer's face, your birth chart, chat, and a rupee clock.

- Modes: chat, call, video. WebRTC with STUN. Optional TURN if RTC credentials are set.
- Face of the practitioner, natal chart rail, in-room chat.
- Rupee ticker. First three minutes free on the first session, then wallet deduct per minute at the expert's rate.
- If the wallet hits empty, the overlay stops the call and offers UPI top-up. It does not silently continue.
- Save this line with a date writes a prediction into Results. Without a date it is not saved.
- Speak uses the browser voice. Call/video can speak the answer back.

4.4 Wallet, UPI, and first-time money

Wallet is server-side. The client cannot invent a balance. Fake checkout with confirm:true is rejected (HTTP 403).

Event	Amount	When
Welcome credit	Rs 150	First login, once. Cashback popup.
First session	3 minutes free	Once. Then the ticker.
First recharge bonus	+Rs 50	First UPI pack.
Invite (both sides)	Rs 50 / Rs 50	New account created with code ARJUN (or any user's code).
Seven-day check-in	Rs 10	Streak complete.
Wallet packs	Rs 100 / 300 / 500 / 1000	Bonuses 0 / 30 / 75 / 200. Paid with Razorpay UPI.

UPI path: create order on the server → Razorpay Checkout restricted to UPI → HMAC verify → credit wallet. Webhook is a backup. Test keys are used in this build. Live keys are a go-live step, not faked as success.

4.5 Plans and paid artifacts

Plans cannot be flipped from the client. POST /api/checkout/plan deducts the wallet on the server and writes the plan.

SKU	Price	What it is
Free	Rs 0	Daily sky, 3 tracked predictions, 5 AI questions/month, 3 muhurta/month, 10-day transits.
Plus	Rs 499 / month	Full proof ledger, unlimited AI and muhurta, 45-day transits, yoga detail, reports, Rs 200 talk credit on first buy.
Family	Rs 999 / month	Plus plus up to three more charts under one roof. Rs 300 talk credit on first buy.
Dated PDF	Rs 199	A report of the ledger, not a generic horoscope PDF.
Second opinion	Rs 99	Another expert on the same dated line.

SKU	Price	What it is
Lab / courier SKU	Rs 399	Issues a tracking number. Courier is labelled honestly; it is not a fake live logistics network.
Online puja sitting	Rite fee from wallet	Own room. Not a mall SKU inside Talk now.

4.6 Proof, board, invite, Ask

- Closing a claim in Results writes a row in proofs. GET /api/proofs/:id serves the public card.
- /board reads proof-scores (grouped marked outcomes per expert).
- /app/share shows the user's invite code. Capture on landing via ?from=CODE. Register applies both credits once.
- Ask / companion: POST /api/chat. If XAI_API_KEY is set, answers come from xAI against the natal snapshot. If not, the local Vedic snapshot still answers. GET /api/chat/status reports which path is live. No fake "AI insight" card grid on Home.

4.7 Vedic and chart tools (computed, not copied)

Math lives in src/lib/vedic (Lahiri sidereal). The same engine is exposed on GET /api/sky so the client and the server agree. These pages exist to feed a better dated line, not as a second product.

Route	Tool
/app/kundli	Logged-in D1, dasha, ayanamsa from /api/sky
/app/today	Personal panchang and daily return
/app/grahas	Navagraha live positions
/app/transits	Personal transits (10 days free, 45 on Plus)
/app/muhurta	Timing windows (3/month free)
/app/yogas	Chart yogas (detail on Plus)
/app/sade-sati /app/mangal	Sade Sati and Mangal dosha
/app/gems /app/varshphal	Gem notes and annual chart
/app/ashtakavarga /app/prashna /app/numerology	Ashtakavarga, prashna, numerology
/app/memory /app/reports /app/you	Consultation archive, reports, profile
/app/settings /app/offerings	Account, locale, appearance; claimable offerings against wallet

4.8 Locale and chrome

- English and Hindi. Toggle on landing, auth, and in-app. Dictionary in src/lib/i18n.tsx. Stored as astrolive_locale.
- Login is a white control on the top right of the landing header, always visible, and again in the hero.
- No astrologer photo on the login form. Demo account is a text control, not a face.
- Command menu (Ctrl/Cmd K) searches routes and actions.

5. How it is implemented

Stack

Web: Vite, React 19, TypeScript, Tailwind, React Router, Framer Motion / GSAP on public pages. API: Hono on Node, port 8787. Data: SQLite (better-sqlite3), WAL. Auth: scrypt password hash, bearer sessions. Live: WebRTC signalling on the API, STUN, optional TURN. Pay: Razorpay Orders + Checkout (UPI only) + HMAC verify + webhook. Ask: optional xAI. Vedic: on-device, also /api/sky.

What already behaves like production

- Sessions, register, login, logout. RequireAuth on /app/*.
- Wallet is an append-only wallet_ledger. Balance is not a client field of record.
- Plan changes only through /api/checkout/plan after a wallet debit.
- Live session settle: first free minutes, then debit. Insufficient funds returns 402 with the amount needed.
- Ledger create and close. Close writes proofs. Public GET for a proof does not need a session.
- Referrals table. Invite credit once per new account.
- Daily check-in with streak bonus.
- Proof-scores grouped for /board.
- UPI order/verify. Fake wallet confirm is 403.
- SPA can be served from dist/ by the same API process (npm start).

What is modelled and labelled, not faked as live ops

Push notifications on target_date are modelled as the due state on Home; device push is not wired. TURN is optional. Razorpay is test-mode unless live keys are supplied. The lab/courier SKU issues a tracking code and does not pretend to be a carrier API. Forgot-password does not send mail. Those seams are visible in the UI copy. They are not presented as completed infrastructure.

Why this can scale

Proof pages are static reads. Invite credit is one insert and two wallet rows. Chart math does not call a paid astrology API per page view. Proof-score is a grouped query that can become a nightly view. Voice/video can sit behind a CPaaS using the same room. Nothing in the loop requires a new model of the sky. It requires dates written down and endings made public.

6. Expected impact

Today the category P&L is minutes. CAC is ads. Retention is generic horoscope notifications. Take-rate is a consult-marketplace take-rate. If users actually date a line and mark it, three numbers move: cost to acquire a second user, reason to open the app on a specific morning, and revenue that is not another minute.

Acquisition

A closed card is a URL. It does not need an app install to read. The invite is on the URL. Both sides receive talk credit. That is acquisition with a creative generated by the user's own life, at the cost of Rs 100 of talk inventory (Rs 50 + Rs 50), instead of a permanent UAC bid. This submission does not claim a viral coefficient from a weekend. It claims the mechanism is in the product and can be counted (section 7).

Retention

Home is the due claim when a date has arrived: "Did this happen?" That is an unfinished personal job. Closing it is also a reason to talk again (yes: what is next; no: second opinion at Rs 99; partly: date the rest). The daily horoscope still exists. It is no longer the hook.

Revenue mix

Pay-per-minute stays. That is how the astrologer is paid. On top of that we added: invite and streak credits (talk time, not products in a shop), Plus at Rs 499 to keep every dated result, Family at Rs 999 for extra charts, a dated PDF at Rs 199, a second opinion at Rs 99, and puja as its own session. Plus is not "remove ads." It is "keep the full list of what was predicted and how it turned out."

Supply quality

The public board makes empty confidence expensive. Experts who date claims and accept endings rise. Experts who stay at "soon" do not. A small roster can be more trustworthy than a large one if the rank is outcomes. That is the only supply advantage a challenger can have against AstroTalk's density.

Unit economics already in the prototype

Unit	Value in this build
Chat	from Rs 10 / min
Call / video	from Rs 15 / min
Welcome	Rs 150 once
First three minutes	Rs 0 once
Invite pair	Rs 100 talk inventory, once per new account
Streak	Rs 10 per 7 days
Plus	Rs 499 / month + Rs 200 talk on first buy
Family	Rs 999 / month + Rs 300 talk on first buy
Dated PDF	Rs 199
Second opinion	Rs 99

7. Success metrics

North star

Dated claims closed per weekly active user.

Not minutes (fuel). Not DAU (a horoscope tile can fake that). Not GMV (a mall can fake that). A closed claim means a date was named, time passed, and a human marked an ending. That is the product happening.

Metric tree

Layer	Metric	What it tells us
Input	% of sessions that save a dated line	If low, people talked but did not keep anything.
Input	Median days from save to due date	Too far = forgotten. Too near = noise.
Core	Claims closed / WAU	North star.
Core	Yes / partly / no mix	All-yes is fake. All-no is churn.
Habit	Return on the due date (D1)	The unfinished job.
Habit	7-day check-in completion	Subsidy should follow this, not lead it.
Virality	Public card opens / closed claim	Is the card worth sending?
Virality	Invites accepted / card open	Is the invite load-bearing?
Revenue	Minutes GMV / WAU	Engine still healthy.
Revenue	Plus conversion among users with ≥ 3 closed claims	Ledger as identity.
Trust	Overlap of board top-10 vs star top-10	Must disagree, or the USP is theatre.
Trust	% of no's that stay public	If misses are hidden, the board is fake.

90-day private beta — directional targets

Metric	Target	Kill the idea if
Sessions that save a dated line	$\geq 40\%$	$< 15\%$ after prompt tests
Due-date D1 return	$\geq 35\%$	$< 15\%$
Closed claims / WAU / week	≥ 0.6	< 0.2
Misses left public	$\geq 80\%$ of no's	Hidden misses $> 40\%$
Card opens from share	≥ 1.2 per closed yes	< 0.3
Invite accept on those opens	$\geq 8\%$	$< 2\%$ with credit still on
Plus take among 3+ closers	$\geq 6\%$	Same as all users
Board vs stars, top 10 overlap	$\leq 50\%$	The same ten faces

Counter-metrics

If yes-rate sits above $\sim 75\%$ for a month, people are only dating safe lines. If invite accepts spike while due-date return is flat, we bought users with Rs 50 and did not buy the habit. If minutes fall

while Plus rises, we replaced the expert with a content farm. If misses are in the database but not on /board, we shipped a lie.

8. How to evaluate the prototype

Run

Terminal 1: `cd server && npx tsx index.ts` (API, port 8787). Terminal 2: `npm run dev -- --host 127.0.0.1 --port 5174`. Open <http://127.0.0.1:5174/>

Demo: arjun.sharma@example.com / cosmic2026. Invite: ARJUN.

Suggested walk (about two minutes, unscripted is fine)

Order	Open	Confirm
1	/	Headline. Login on the top right. Hindi toggle.
2	/board	Experts ordered by dated results. Misses are visible.
3	/p/proof-dp2?from=ARJUN	Card opens with no login. Invite on the page.
4	/login then Home	Due claim or daily return. Wallet in the chrome.
5	Talk now → live session	Astrologer, chart, chat. Save a line with a date.
6	Results	The line is there. Did this happen? Mark it.
7	Wallet / Plus	UPI packs. Plans. A plan cannot be turned on from the browser alone.
8	Reels, Puja, Ask	Short videos, online puja session, Ask AI.

Scorecard — where each criterion lives

Criterion	In this document	In the product
Problem comprehension	Section 1	Landing, Why this
Teardown of AstroLive	Section 2	Landing loop vs mall; we did not clone the shop
Solution design	Section 3	The loop. Save with a date. Public card.
Prototype functionality	Section 4	Routes in the appendix. Working API + demo user.
Uniqueness	Sections 2–3	/board and /p/:id, including misses
Scalability / feasibility	Section 5	Server checkout, wallet ledger, public GET proofs
Business impact	Section 6	Wallet, Plus, invite, PDF, second opinion
Success metrics	Section 7	Close, invite, board — all observable this weekend
Report clarity	This file	This file

Difference from AstroTalk: AstroTalk sells minutes, then a shop. This app also sells minutes, then asks you to date the prediction and mark the result. That public result is how people share the app, how they come back, how experts are ranked, and why someone would pay for Plus. If you remove that dated result, you are left with astrolive.app, which is what section 2 already describes.

9. Appendix

9.1 Authenticated routes (complete)

Route	Surface
/app/dashboard	Home
/app/reels	Reels
/app/consult	Talk now — expert list
/app/room/:id	Live session (chat / call / video)
/app/puja	Puja list
/app/puja/session/:id	Puja sitting
/app/ledger	Results — dated claims
/app/companion	Ask AI
/app/wallet	Wallet and UPI packs
/app/subscription	Free / Plus / Family
/app/share	Invite code
/app/today	Personal today / panchang
/app/kundli	Logged-in chart
/app/grahas /app/transits /app/muhurta /app/yogas	Live grahas, transits, timing, yogas
/app/sade-sati /app/mangal /app/gems /app/varshphal	Sade Sati, Mangal, gems, annual
/app/ashtakavarga /app/prashna /app/numerology	Ashtakavarga, prashna, numerology
/app/memory /app/reports /app/you /app/settings	Archive, reports, profile, settings
/app/offerings	Wallet claims (gems / aarti style, not a mall)
/onboarding	Birth details and first pass

9.2 API (complete enough to audit)

Method	Path	Role
POST	/api/auth/register /login /logout	Accounts
GET/PATCH	/api/me	Profile, including wallet from the server
POST	/api/checkout/plan /session /fee	Plans, live settle, PDF / opinion / puja / ship
POST	/api/pay/upi/order /verify /webhook	Real UPI
GET	/api/pay/upi/config	Whether UPI is enabled
POST	/api/ledger /ledger/:id/close	Create and close dated claims
GET	/api/proofs/:id /proof-scores /tape	Public proof, board, tape
POST	/api/checkin	Daily streak
GET	/api/invite/:code	Invite preview

Method	Path	Role
POST	/api/chat GET /api/chat/status	Ask AI
GET	/api/sky /panchang /kundli /horoscope	Computed Vedic
POST	/api/match	Guna milan
POST	/api rtc/room /join /signal GET /ice /poll	Live room
GET	/api/practitioners /claims /orders	Roster, offerings, order history

9.3 Honest limits of this build

- Razorpay is test-mode unless live keys are in server/.env. Do not treat a test payment as a rupee in a company bank account.
- WebRTC uses STUN; some NATs need TURN, which is optional.
- xAI is optional. Without the key, Ask uses the local snapshot.
- Forgot-password does not send email.
- Lab/courier tracking is a generated code, labelled as such.
- Device push on due dates is not wired. The due state on Home is.
- This is a prototype roster of practitioners, not 10,000 live experts.

Summary for judges

AstroLive is a live astrology consultation app. You talk to an expert, pay from a wallet, save what they predicted with a date, and later mark whether it came true. That result is a public page. That is what we made, and that is what the running prototype does.
